

AI Use Declaration

1. AI Tool Used

The primary AI tool used in this project was Claude AI, developed by Anthropic. It was used to assist with debugging, explaining programming concepts, reviewing code, and improving documentation during the development of the DreamHome system.

2. Purpose of Use

Claude AI was used during the development of the DreamHome system as a support tool for learning, debugging, and improving the project. It helped the team troubleshoot coding errors related to routing, controller functions, database queries, and CRUD operations in Laravel. The AI was also used to explain programming concepts and Laravel features in simpler terms to improve understanding during development. In addition, it assisted in refining project documentation, improving grammar and organization, and suggesting UI layout and dashboard design ideas. Claude AI also provided sample code structures and guidance for authentication setup, which were reviewed and modified based on the project requirements.

3. Sample Prompts Used

The following prompts were submitted to Claude AI during the development process:

- “how do i set up laravel breeze for login and registration? i already installed laravel but i don’t know what to do next”
- “my controller is returning data but the blade file is not showing it, what could be the issue?”
- “how do i write a migration for a customers table with a foreign key linked to the users table in laravel?”
- “can you suggest a simple and clean dashboard layout for a property management system like dreamhome?”
- “can you explain how MVC architecture works in laravel and why separating models, views, and controllers is important in system development? ”

4. Output Used

Not all AI-generated outputs were used exactly as provided. The team carefully reviewed and evaluated each suggestion before applying it to the project. Explanations related to Laravel concepts such as routing, middleware, and database migrations were accepted and used as study references to better understand the framework. Some code snippets for authentication setup and database queries were partially adopted but modified to match the specific table structure and requirements of the DreamHome system. Suggested UI and dashboard layout ideas were also used as inspiration,

although the final design was adjusted according to the project's functional requirements and instructor guidelines. Certain outputs, especially those that did not match the project's database structure or included unnecessary features and dependencies, were rejected and replaced with manually written solutions.

5. Student Reflection

Using Claude AI during the development of this project helped the team better understand programming and system development concepts. It was mainly used for explaining Laravel functions, identifying coding errors, suggesting solutions, and improving documentation. The tool also provided faster explanations and examples, which reduced the time spent searching through online resources during development. However, the team learned that AI-generated outputs should always be verified before implementation, since some suggestions needed modification while others did not match the project requirements or system design. All generated codes and explanations were manually tested and reviewed to ensure accuracy and functionality. Overall, the experience showed that AI is a useful support tool, but human understanding, validation, and critical thinking are still necessary.
